Introduction

In the modern digital age, the recruitment process has shifted from traditional methods to online platforms. Earlier, job searching and hiring involved manual efforts such as newspaper advertisements and physical resume submissions, which were time-consuming and inefficient. With the growth of the internet, job portals have made it easier for candidates and recruiters to connect on a single platform. Online platforms like LinkedIn, Indeed, and Naukri.com have simplified job searching and recruitment by providing easy access to job listings and candidate profiles. However, there is still a need for systems that offer better user experience, organized dashboards, and efficient management of applications.

This project proposes a **Job Portal System with Recruiter and Candidate Dashboards** that aims to simplify the hiring process. Candidates can create profiles, upload resumes, and apply for jobs, while recruiters can post job openings, review applications, and shortlist candidates. The system focuses on improving efficiency, reducing time, and providing a smooth experience for both users.

Problem Statement

Many existing recruitment systems lack user-friendly interfaces, real-time updates, and efficient filtering mechanisms. Candidates struggle to find relevant job opportunities, while recruiters face difficulty in managing applications and identifying suitable candidates quickly. There is a need for a streamlined system that improves communication, transparency, and efficiency in the hiring process.

Objectives

- ☐ To develop a centralized job portal system.
- ☐ To create separate dashboards for recruiters and candidates.
- ☐ To enable job posting, application tracking, and profile management.
- ☐ To provide advanced search and filtering options.
- ☐ To improve hiring efficiency and user experience.

Literature Review

Existing platforms like **LinkedIn**, **Indeed**, and **Naukri.com** provide job search and recruitment services. However, many systems either focus more on networking or lack personalized dashboards and analytics. Research shows that user-centric dashboards and AI-based filtering significantly improve recruitment outcomes. This project builds upon these insights to design a simplified yet efficient system.

Proposed Methodology

The proposed system is a web-based job portal with two primary modules:

- **Candidate Module:** Allows users to create profiles, upload resumes, search for jobs, and apply.
- **Recruiter Module:** Enables job posting, applicant tracking, and candidate filtering.

Additional features include:

- Real-time notifications
- Resume parsing
- Dashboard analytics
- Secure authentication system

System Architecture

The system follows a **3-tier architecture**:

- **Presentation Layer:** User interface (HTML, CSS, JavaScript/React)
- **Application Layer:** Backend logic (Node.js)
- **Database Layer:** Data storage (MongoDB)

Modules:

- User Authentication Module
- Job Management Module
- Application Tracking System
- Dashboard & Analytics Module

Implementation Plan

- **Phase 1:** Requirement gathering and system design
- **Phase 2:** Database design and backend development
- **Phase 3:** Frontend development (UI/UX design)
- **Phase 4:** Integration of modules
- **Phase 5:** Testing and debugging
- **Phase 6:** Deployment and maintenance

Technologies to be used:

- Frontend: HTML, CSS, JavaScript (React)
- Backend: Node.js / Django
- Database: MySQL / MongoDB

Expected Results

- ☐ A fully functional job portal system
- ☐ Easy job search and application process for candidates
- ☐ Efficient recruitment management for recruiters
- ☐ Improved matching between job requirements and candidate profiles
- ☐ Reduced hiring time and effort

Conclusion

The proposed job portal system aims to bridge the gap between recruiters and job seekers by providing a structured and efficient platform. With dedicated dashboards and smart features, the system enhances usability, reduces complexity, and improves the overall recruitment experience.
